Roll No: 25A31A05GI

Introduction

This project is a Student Attendance Management System developed using C.

It stores student details and calculates attendance percentage.

The project demonstrates basic programming concepts.

Objectives

- Store student details
- Calculate attendance percentage
- Display attendance report
- Understand real-world use of C programming

Structure – Definition

A structure is a user-defined data type in C.

It allows grouping different data types under a single name.

Here, it is used to store student details.

Structure – Code Snippet

```
struct Student {  
    int rollNo;  
    char name[50];  
    int totalDays;  
    int presentDays;  
};
```

Function – Definition

A function is a block of code that performs a specific task.

Functions improve readability and reusability of code.

This project uses a function to calculate attendance percentage.

Function – Code Snippet

```
float calculatePercentage(int present, int total) {  
    return ((float)present / total) * 100;  
}
```

Arrays & Loops

An array of structures is used to store multiple students.

Loops are used to input and display student data efficiently.

Sample Input

Enter number of students: 2

Student 1:

Roll Number: 101

Name: Raju

Total Working Days: 30

Total Present Days: 26

Student 2:

Roll Number: 102

Name: Ravi

Total Working Days: 30

Total Present Days: 20

Sample Output

----- Attendance Report -----

Roll No	Name	Present/Total	Percentage
101	Raju	26/30	86.67%
102	Ravi	20/30	66.67%

Advantages

- Simple and easy to use
- Reduces manual calculation
- Improves logic building

Conclusion

This project helps understand structures, functions, arrays, and loops.

The project can be enhanced further in future.
